

Protection of Vehicle Data

Overview

Vehicles often have unstable internet connections, so there are cases where data cannot be immediately uploaded to the cloud. This leads to increased risks of data tampering. We built an End to End data protection system from the vehicle to the cloud. This system incorporates data protection technology, which uses our own blockchain technology on the vehicle.

Detail Explanation

This Blockchain-powered system can work without internet connection and protect data in-vehicle. Protected data is then uploaded to a cloud-based general blockchain to prevent tampering.

Vehicle Data can be protected from the vehicle to the cloud with blockchain

Feature

We can get accurate data regarding the value of the vehicle and secondary use information on automotive batteries such as charging/discharging history.
